

How to Care For Your Terrarium

Watering:

Consistently over watering succulent plants will kill them. If the plant is **over** watered on a regular basis, it will start to rot at the base.

So, always be sure to always check your plant's soil before watering it, and water only when the soil is completely dry.

To check if your succulent needs water, stick your finger or your chopstick one inch into the soil. If the soil is damp, don't water it.

Check on your plants approximately every 7 days.

Sunlight Requirements:

The second most important indoor plant care tip is light.

Do succulent plants need a lot of sunlight? Yes! They need a lot of light in order to grow strong and thick. They will start to grow weak if they aren't getting enough light.

To avoid a weak plant, you'll want to give it as much light as possible. It's best to place plants next to a south facing window inside the house.

If the plant isn't getting enough light, consider adding a **grow light**. Indoor plant grow lights will help to give your plant enough light to thrive if you don't have a sunny window to put it in.

DO NOT LET PETS NEAR YOUR TERRARIUM.
PLANTS CAN BE POISONOUS TO ANIMALS.
